A Toy Paper

Test Author

October 21, 2026

Abstract

The method reaches 95% accuracy on the test set. It runs in 1.39 ms per frame. It beats the baseline. We train the classifier in three stages.

1 Introduction

Prior work uses Kalman filters. This paper learns the mapping instead.

2 Methods

We train a classifier in three stages, each starting from the previous weights.

3 Results

The classifier reaches 95.2% accuracy on the test set. Latency is 1.388 ms per frame. Stage 2 is evaluated second. The method is twice as fast as the older design.

4 Conclusion

The classifier is accurate and fast.
